

1. pairs <command> - <line|word|symbol> to explain how you fix modified text to make it the same as original.
vimdiff original_txt.txt modified_tst.txt - to observe the difference between files.

dd - < line 9 | this line looks suspicious > - to remove the whole redundant “this line looks suspicious” line.

dw - < line 11 | Double > - to remove whole “Double” word.

d3l - < line 17 | fff > - to remove 3 “fff” symbols by moving the cursor to the right

:19, ctrl + V < line 19 | shaping bread in the kitchen, wait > - move cursor to line 19 and paste missed line.

dd - for removing empty lines.

enter - for moving lines.

wq! - for saving changes.

2. short description of how to use SSH to connect to GitHub

1. ssh-keygen -t ed25519 -C ‘email from GitHub account’

2. cat ~/.ssh/your_key.pub

3. copy it and add it to the GitHub account (SSH and GPS keys)

4. I have multiple SSH keys, so I needed to set up an SSH key for GitHub

nano ~/.ssh/config

5. Add config

Host github.com

User git

Hostname github.com

IdentityFile ~/.ssh/your_key

6. Check connectivity

ssh -T git@github.com
